Business Problem Statement

The main objective of this project is to understand customers' shopping behaviour and identify the factors that influence their purchasing decisions. The retail company wants to use customer data to improve sales, increase customer satisfaction, and build long-term customer loyalty.

Different customers have different shopping habits depending on their age group, product preferences, discounts, customer reviews, seasons, payment methods, and shopping channels (online or offline). By analysing these patterns, the company can better understand what customers prefer, what influences their buying decisions, and what encourages them to make repeat purchases.

Through this project, I aim to analyse the consumer behaviour dataset and find useful insights that can help the company make better business decisions. The main focus is on identifying customer trends, understanding purchasing patterns, and suggesting ways to improve marketing strategies and customer engagement.

Project Deliverables

1. **Data Preparation using Python:** Clean the raw dataset, handle missing or inconsistent values, and prepare the data for further analysis.
2. **Data Analysis using SQL:** Store the cleaned data in a structured database and use SQL queries to analyse customer segments, purchasing patterns, loyalty, and factors affecting buying decisions.
3. **Dashboard Development using Power BI:** Create an interactive dashboard to present important trends, customer preferences, and shopping behaviour in an easy-to-understand visual format.
4. **Project Report and Presentation:** Prepare a report explaining the analysis, major findings, and practical recommendations. Present the results using charts and visualisations to explain how the company can improve its business strategies.
5. **GitHub Repository:** Upload and organise the Python code, SQL queries, Power BI dashboard, and other project-related files in a structured GitHub repository.
